

Hydra Bruteforce using kali linux Report

First open the owaspbwa and I logged into the bwapp :

I login to invalid name to try to log in on the bwapp it gave a Invalid credential or user not activated. I have gathered a error message for the hydra tool

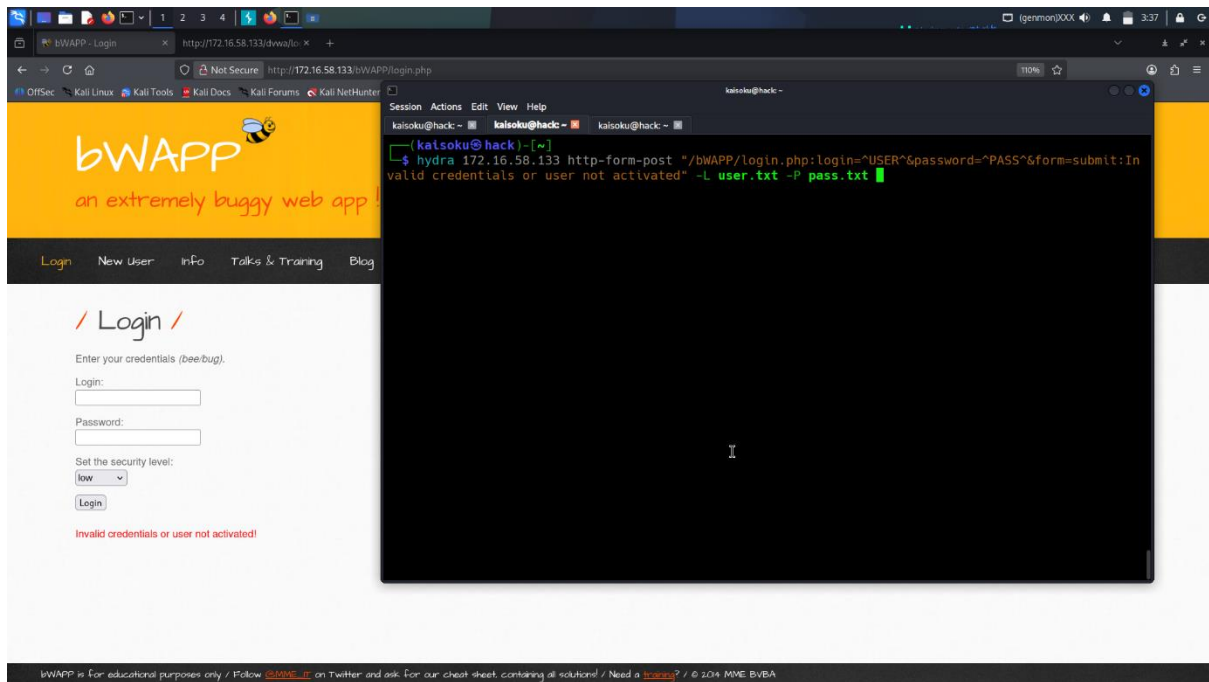

Before cracking the user name we should gathering a information from our target.then only we can crack the password and user name.

1st step I created a two text file user.txt and password.txt

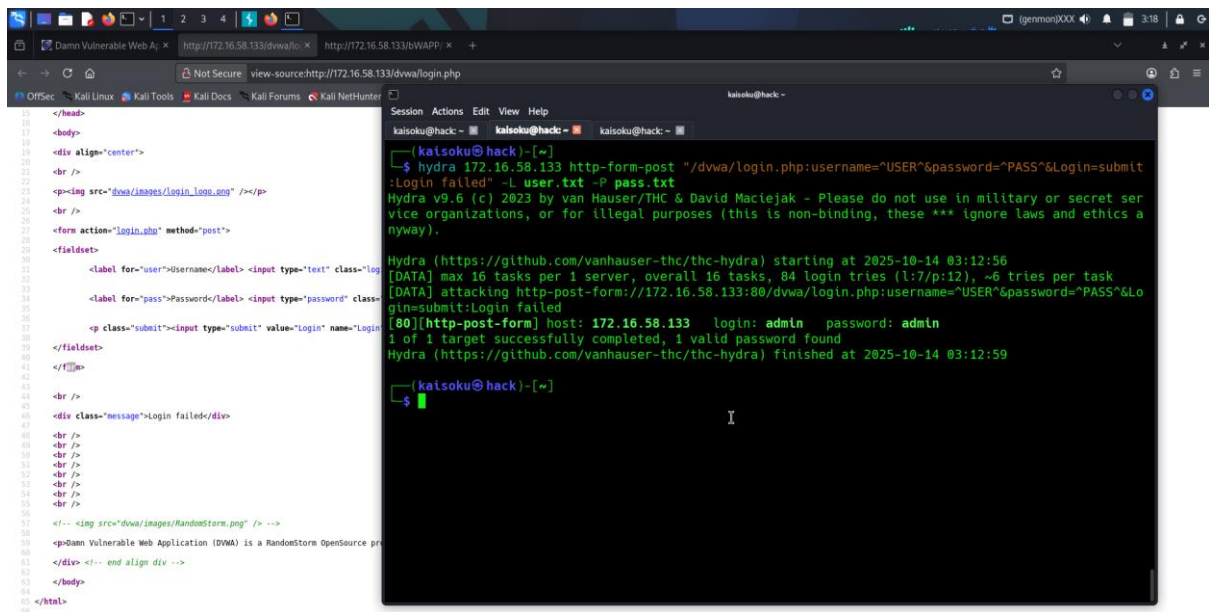

2nd step I have added on that text file some random names and the victim name and password also it is going to help for the hydra tool

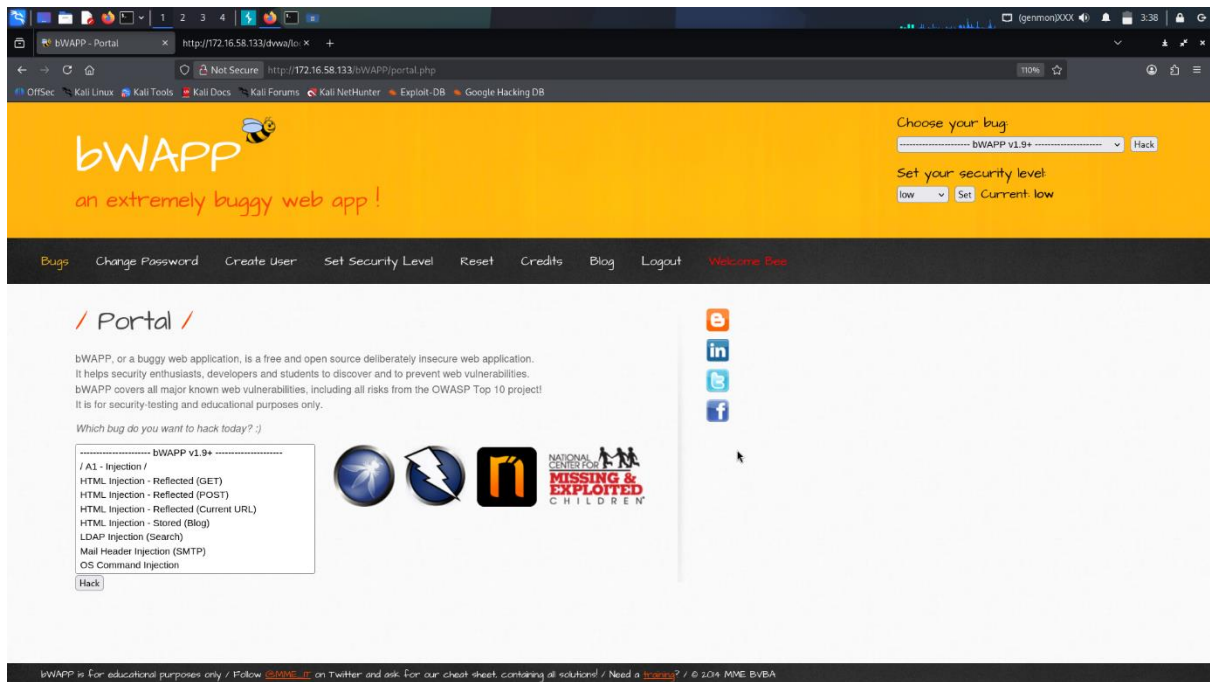

3rd Step I used Hydra command:

Hydra 172.16.58.133 http-form-post
"/bwapp/login.php:login=^USER^&password=^PASS^&form=submit:Invalid
Credentials or user not activated -L user.txt -P pass.txt

The final step that is cracked by the hydra

Finally I successfully cracked the user name and the password and logged in to the bwapp
